User database

As a customer i want to get all the info about particular user.

💡 Use proper data structure.
Search should be case non-sensitive (`Mike` and `mike` should have same result).
You don't need to provide particular user's name via cli parameter or flag, just do in code (statically).

```go
package main

type user struct {
  name string
  age uint8
  email string
}

func main() {
  users := []user{
    {
      name: "Mike",
      age: 32,
      email: "mike@gmail.com",
    },
    {
      name: "John",
      age: 54,
      email: "john@gmail.com",
    },
    {
      name: "Abobus",
      age: 2,
      email: "abobus@gmail.com",
    },
  }
}
```
